SAMARTH SAXENA

samarthsaxena1672003@gmail.com
Software Engineer • Consumer AI Agents, Browser Use & Memory

DETAILS

Noida, India
Portfolio
GitHub
LinkedIn
X (formerly Twitter)
YouTube
Hashnode

CORE SKILLS

Languages
TypeScript, JavaScript, Python, Rust, Go, Solidity

Agent systems
Browser agents (Playwright), long-running agents, graph memory, tool use, MCP, approval gates

Application & infrastructure
Node.js, React, Next.js, APIs, PostgreSQL, Docker, uv, SDKs, CLIs

Integrations & testing
Payments, spend limits, Gmail, Discord, Slack, webhooks, Vitest

EDUCATION

BTech, Computer Science
Specialization in Blockchain Technology
VIT University
2021 - 2025

TECHNICAL COMMUNICATION

Protocol explainers and project demos received **17K+ views** on X in the past year.

PROFILE

TypeScript-first software engineer (working Python) building agents that act for people: persistent browser use, long-running orchestration, source-backed memory and approval-gated spending. Shipped SDK tooling and a reference agent for RISEx ($1B+ cumulative exchange volume) and integrations inside unfamiliar codebases, owning products end to end.

EXPERIENCE

Full-Stack Developer Relations Engineer | RISE Chain
Oct 2025 - Mar 2026
Built TypeScript wallet products, SDK tooling, integrations, and reference applications for RISE and RISEx, a fully onchain perpetuals exchange that surpassed **$1B in cumulative volume** and **$100M in daily volume**.

- Worked directly with multiple external teams inside their codebases to debug and ship RISE Wallet integrations, including helping a gaming app replace browser-stored keys with EIP-7702 accounts and scoped session permissions.
- Owned the end-to-end revamp of RISE's developer documentation and built supporting example projects for developers.
- Shipped v0.3.0 of RISE's Viem-based Shreds SDK, updating RPC types and formatters for backend changes, repairing tests, and publishing the npm release.
- Built a TypeScript reference agent for RISEx APIs with natural-language operations, passkey linking, P256 session permissions, and Vitest-covered relay flows.

Full-Stack Engineer & Technical Writer | LearnWeb3
May 2023 - Jan 2025
Built hands-on AI and blockchain curriculum and technical projects for LearnWeb3.

- Built hands-on projects for the AI Degree, reaching **25K+ content views**, and revamped technical projects in the Ethereum Degree.
- Contributed full-stack and smart-contract engineering to Nucleo Finance, a product developed by the same team.

SELECTED PROJECTS

Pebble ↗ — TypeScript, Playwright, FalkorDB
Built an open-source personal agent (alpha) with a persistent Playwright browser for search, navigation, forms and signed-in sessions with pause/takeover, source-backed graph memory with multi-hop retrieval, Gmail/Discord tools and local voice; reviews gate consequential actions.

Ronin ↗ — TypeScript, Centaur, agent workflows
Built a multi-tenant agentic solutions engineer on Paradigm's Centaur that routes GitHub, Slack and Telegram requests to repositories, runs sandboxed work and opens reviewable PRs. Brokers short-lived, exact-repository GitHub tokens into the session proxy so they never reach prompts or logs; upstreamed a merged fix to Centaur.

Agentis ↗ — TypeScript, multichain payments, OAuth MCP
Built a financial operations layer that lets agents spend safely: shared USD spend limits, scoped credentials, owner approvals and pause; card payments via Agentcard plus x402/MPP. Shipped SDK, CLI, dashboard and OAuth MCP.

Watchdog ↗ — TypeScript, Codex, Pi, agent observability
Built and published a local-first control plane for Codex and Pi with live subagent topology, capability-aware controls, execution graphs, token/cost accounting, trace replay, and browser/TUI interfaces.

Privy CLI ↗ — TypeScript, CLI, npm
Built and published an agent-friendly CLI that manages Privy developer accounts and apps through largely undocumented dashboard APIs: discover, schema, preview/diff, execute and verify workflows, JSON-first output and OS-backed credential storage.

SELECTED TECHNICAL CONTENT

Privy Embedded Wallets: Explanation + Demo ↗ — Video
Explained embedded wallets and signatureless dApp transactions through a working starter-kit integration.

Zero to Dev ↗ — Video series
Developer tutorials for building applications on blockchain protocols.

Foundry Mode ↗ — Article series
Wrote a comprehensive tutorial series covering smart-contract development with Foundry.

RainbowKit with a Custom Network ↗ — Article
Documented how to configure RainbowKit for networks that are not supported by default.
